

BTEC Applied Science first appealed to me because it was a mixture of both coursework and examinations. This would help me prepare better for university life after college, as university requires a mixture of skills for both coursework and exams. Despite not being very used to much coursework, I quickly began to enjoy the assignments.

As well as being taught all the content thoroughly, the course in some cases allowed me to undergo my own research and work independently. For example, we were tasked with an independent research unit in which the subject could be based around anything scientific, and required us to gather our own results.

Melanie my tutor was very kind to assist with this, and helped provide specialist equipment for myself and another student. The exams were spread out evenly between the two years, which allowed for better preparation leading up to them. This course enabled me to unlock my full potential, whilst providing me with organisation, time management and independent study and research skills.

The biology, chemistry and physics integrated within the course has supplied me with lots of knowledge around these subjects. I have received an offer to study Audiology at the University of Leeds, which is within the top fifteen universities in the UK. I look to further applying my skills at university and have a future career in audiology. I would like to thank all my teachers for all their excellent help and support they've provided.

Kind regards
